

# Work or Leisure: A false dichotomy in the case of Singapore's older persons

Abhijit Visaria, PhD

Research Fellow, Centre for Ageing Research and Education

Older Singaporeans at a Crossroads

Centre for Ageing Research & Education (CARE) 2019 Symposium

8 May 2019

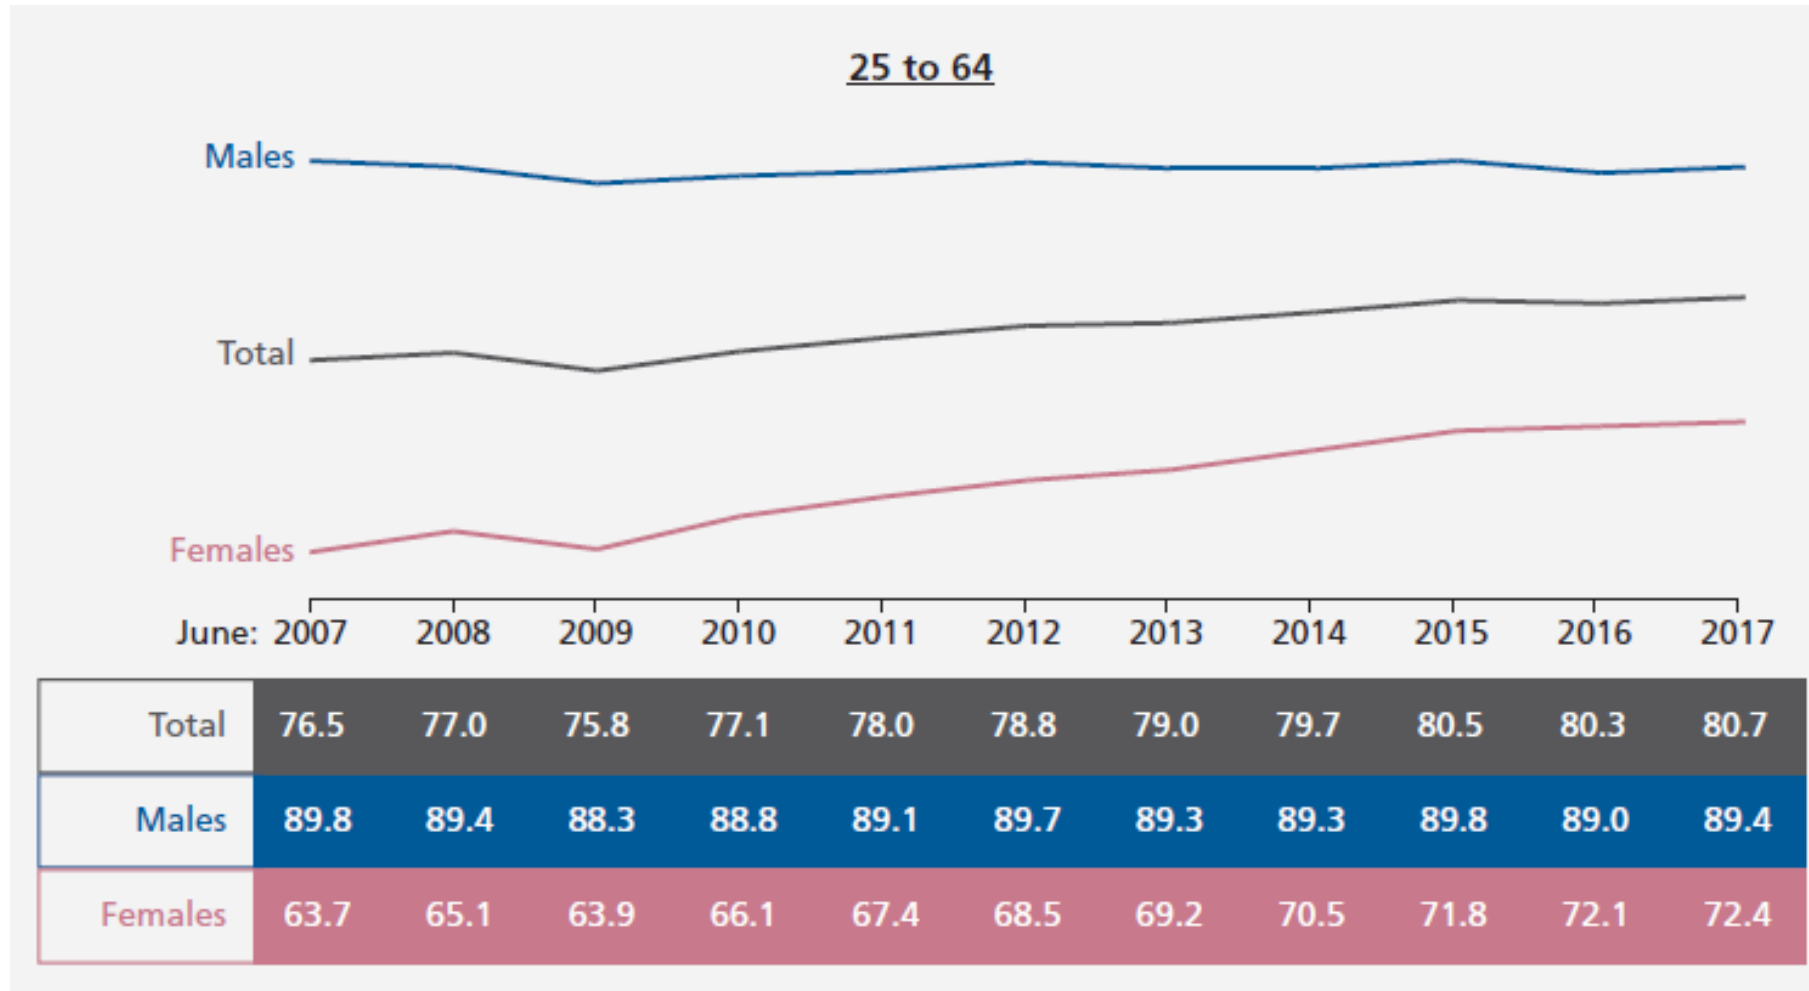

# Why work at older ages?

- Opportunity to be engaged, productive, and generative
- Later retirement associated with higher self-rated health, better memory, lower risk of dementia, lower likelihood of clinical depression
- Involuntary job loss and perceived lack of control during retirement associated with higher stress and worse physical health post-retirement
- Pathways include cognitive stimulation, social networks, income adequacy

# Significance of Older Workers to Singapore

- Rapidly ageing society
- Declining old age support ratio in Singapore
  - Number of persons in the age-group of 20-64 years per 1 person aged 65 years and older
  - In other words, ratio of population more likely to be economically active (*and therefore capable of providing support*) to older adults more likely to be economically inactive (*and therefore potentially dependent on others*)
  - Declined from 11.4 in 1980 to 8.4 in 2000, to 4.2 persons in 2018
  - Projected to decline to 2 in 2030
- If total fertility rate remains low, immigration remains constant, and labour force participation rates remain constant, Singapore likely to face a shrinking labour force within the next 20 years

# Labour Force Participation

Resident population of Singapore. Comprehensive Labour Force Survey 2017,  
Manpower Research and Statistics Department, Ministry of Manpower, Singapore

# Labour Force Participation among Older Adults

Resident population of Singapore. Comprehensive Labour Force Survey 2017, Manpower Research and Statistics Department, Ministry of Manpower, Singapore

# Older Workers in Singapore

- Increase in labour force participation rates among older adults
  - Increase in statutory retirement age from 55 to 60 in 1993, to 62 in 1999
  - Legislation in 2012 mandated re-employment from 62 onwards
  - Increase in re-employment age from 65 to 67 years with RRA Amendment of 2017
  - Incentivized for employers through the Special Employment Credit
- Potential to improve rates even further

# Distribution of Employment Status in THE SIGNS Study – I

|   | Weighted % |                    |                    |             |               |

# Compared to 2009...

## Employment Status, 2009 (PHASE – I) and 2016-2017 (THE SIGNS Study – I)

### Distribution of employment status among older adults aged 60+, weighted %

|                           | 2009 | 2016-2017 | Absolute Difference | Relative Difference |
|---------------------------|------|-----------|---------------------|---------------------|
| Working full-time         | 17.6 | 24.3      | 6.8                 | 38.4                |
| Working part-time         | 8.9  | 12.5      | 3.5                 | 39.4                |
| Currently working         | 26.5 | 36.8      | 10.3                | 38.9                |
| Retired and not working   | 47.0 | 54.8      | 7.8                 | 16.6                |
| Never worked <sup>^</sup> | 26.5 | 8.3       | -18.2               | -68.6               |

<sup>^</sup> Response option in PHASE was "Homemaker" to the question, "are you currently working?" whereas in THE SIGNS Study, the response option was "never worked" to the question, "what is your current work status?"

# Compared to 2009...

# Research Questions

- Who is currently working?
  - Among older adults in Singapore, what are the correlates of current employment? Which factors – demographic, socioeconomic, and health – are correlated with current work among older adults?
- Who retired early?
  - Among currently retired and non-working older adults, what are the correlates of early retirement?
- Who is looking for work?
  - What are the correlates of recently looking for work among ever-worked older adults who are currently retired or not working?

# Measures of Employment

- Currently working
  - Response options on current work status included working full-/part-time, retired and/or not working, and never worked
  - Currently working in this analysis includes working full-time and working part-time
- Early retirement
  - Among those who report that they are currently retired and/or not working, respondents were asked, "Did you take early retirement, that is did you retire before the normal retirement age?"
- Looking for work
  - All currently retired and/or not working individuals were asked, "have you been doing anything to find work during the last four weeks?"

# Explanatory Variables

- Demographic factors: current age, male/female, ethnicity, marital status, living arrangements
- Socioeconomic status: education, housing type, income adequacy
- Health: Chronic physical ailments, ADL and IADL limitations
- Work: Occupation in which respondent spent the longest time; and, in analysis for 'finding work': if respondent took early retirement, and total duration of employment in years

# Methods

- Each of the three dependent variables (currently working, early retired, looking for work) is dichotomized as yes/no
- Multivariate logistic regression models
- Analysis for full sample, and two specific age-sub groups: ages 60-64 and 65-69
  - Age for formal retirement for most; recent retirees
  - Potentially higher possibility of retaining older adults in the workforce
- All analysis excludes individuals who reported that they had never worked (N=469) to ensure that the study of each of the three work variables is made among comparable individuals who have 'ever-worked'

# Descriptives: % Currently Working

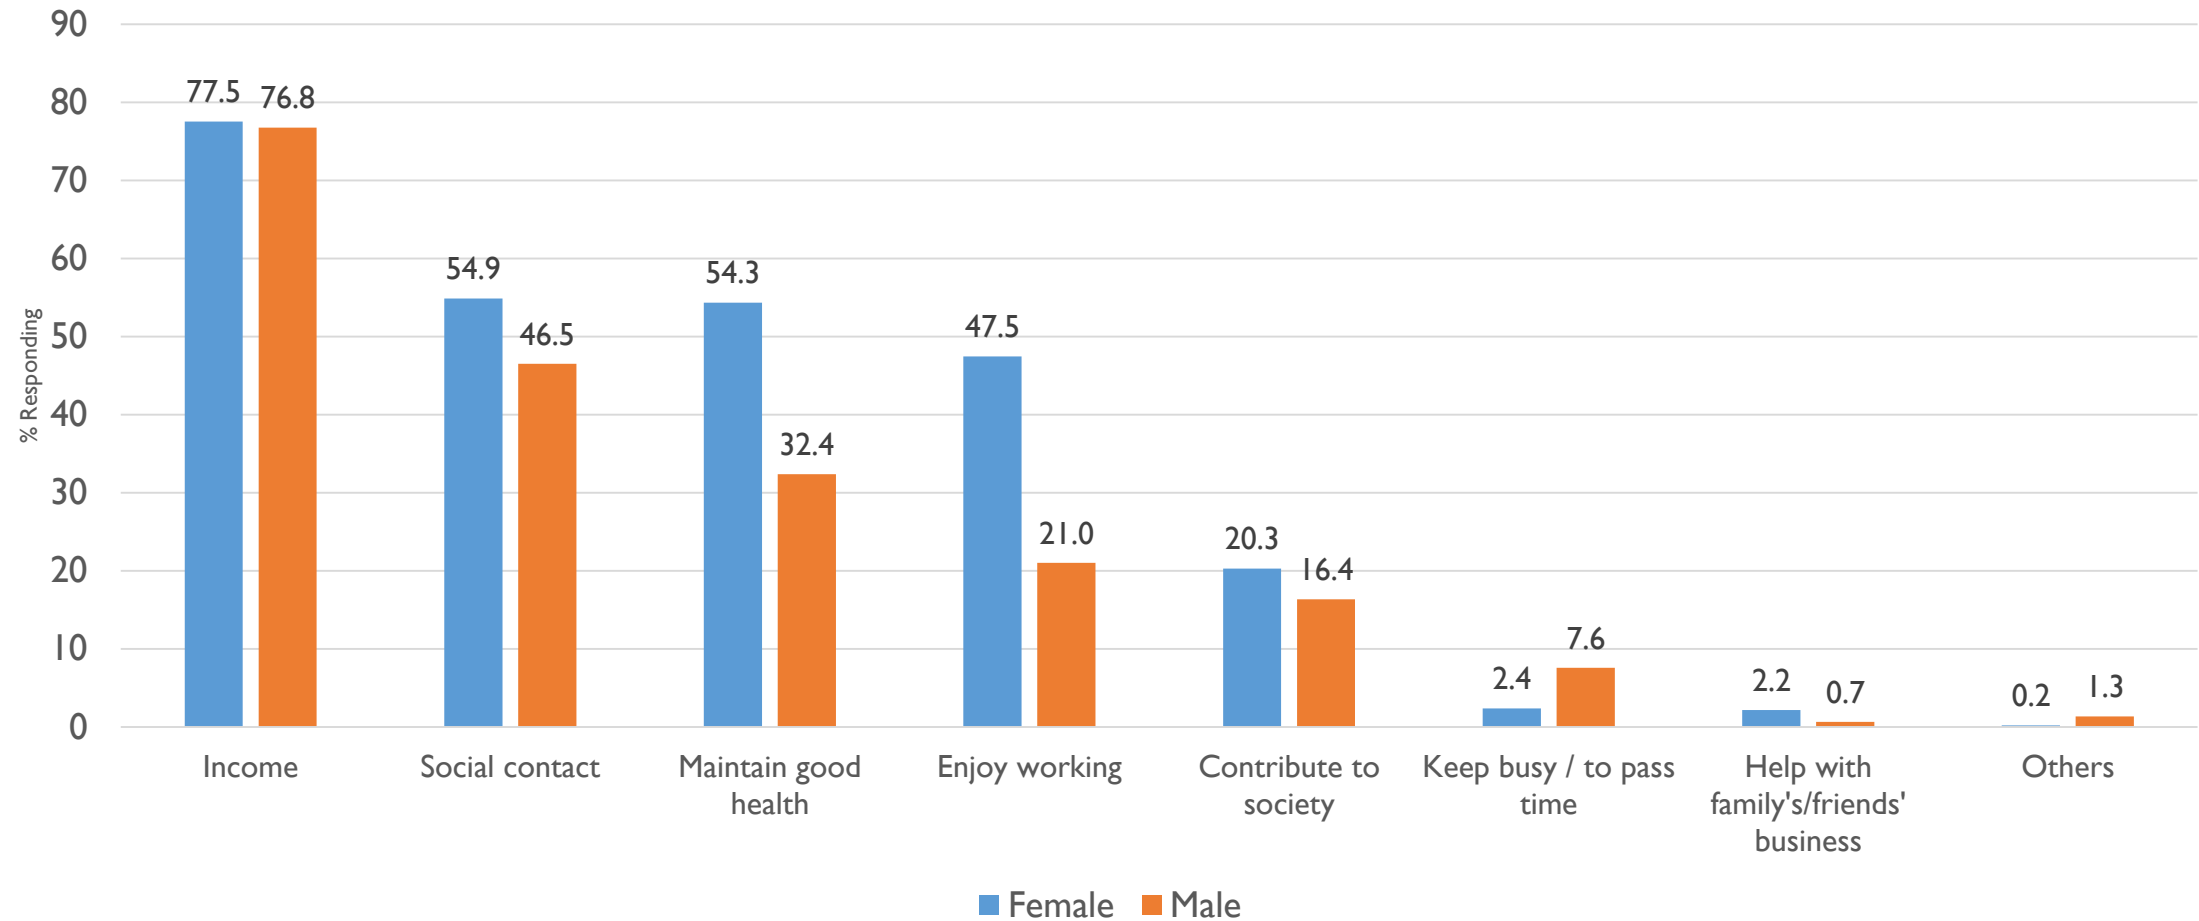

|   | % Currently Working |             |             |
|---|---------------------|-------------|-------------|
| Gender  | All ages            | 60-64 years | 65-69 years |
| Male  | 45.0                | 72.9        | 59.4        |
| Female  | 31.4                | 50.9        | 38.1        |
| Education                                     |                     |             |             |
| No formal education                           | 27.5                | 55.8        | 49.3        |

| N                                      | 3615        | 923         | 946         |

Less likely to work:

*At all ages, those with...*

Primary education

Better-off in housing type

Difficulty in meeting household expenses

Worse health

*Specifically 60-64: only those with worse health*

Note: \*\*\*  $p < 0.001$ , \*\*  $p < 0.01$ , \*  $p < 0.05$ .

All models also include age (in years) and social networks (tertiles of Lubben Social Network Scale – Revised scores), and occupation in which respondent spent the longest, not presented here.

# Multivariate Results: Early Retirement

|  | Odds Ratios |             |             |
|--|-------------|-------------|-------------|
|  | All Ages    | 60-64 years | 65-69 years |
| <b>Demographic Characteristics</b>     |             |             |             |
| Gender (Ref. = Male)                   |             |             |             |
| Female                                 | 3.25***     | 2.46**      | 2.65***     |
| <b>Socioeconomic Status</b>            |             |             |             |
| Education (Ref. = No formal education) |             |             |             |
| Primary                                | 1.46**      | 2.04        | 0.97        |
| Secondary/vocational/ITE               | 1.42*       | 2.56*       | 1.26        |
| JC/Polytechnic/University and above    | 1.91**      | 4.03*       | 2.04        |
| <b>Physical/Functional Health</b>      |             |             |             |
| ADL limitations (Ref. = None)          | 1.63*       | 4.25        | 2.18        |
| IADL limitations (Ref. = None)         | 1.12        | 1.07        | 1.05        |
| Chronic conditions (Ref. = None)       | 1.00        | 0.77        | 1.15        |
| <b>N</b>                               | 2112        | 339         | 455         |

More likely to have retired early:

Women

All educational levels compared to no formal education

Those with ADL limitations

Note: \*\*\*  $p < 0.001$ , \*\*  $p < 0.01$ , \*  $p < 0.05$ .

All models account for age (in years), ethnicity, marital status, living arrangements, housing type, income adequacy, social networks, not presented here.

# Multivariate Results: Looking for Work

| <b>Demographics</b>               | All Ages |  |
|-----------------------------------|----------|--|
| Age group (Ref. = 60-64 years)    |          | Less likely to be looking for work:      |
| 65-69 years                       | 0.26***  |  |
| 70-74 years                       | 0.26***  |  |
| 75 and above                      | 0.07***  | Older persons                            |
| Gender (Ref. = Male)              |          |  |
| Female                            | 0.50*    | Women                                    |
| <b>Socioeconomic Status</b>       |          |  |
| Housing type (Ref. = HDB 3 rooms) |          | Better-off in housing type               |
| HDB 1-2 rooms                     | 0.84     |  |
| HDB 4-5 rooms                     | 0.54*    |  |
| Private housing and others        | 0.11**   |  |
| Income adequacy (Ref. = Enough)   |          | Those with chronic health conditions     |
| Some/much difficulty              | 2.17**   |  |
| <b>Physical/Functional Health</b> |          |  |
| ADL limitations (Ref. = None)     | 0.13     | Those who retired early                  |
| IADL limitations (Ref. = None)    | 1.31     |  |
| Chronic conditions (Ref. = None)  | 0.49*    | More likely:                             |
| <b>Work</b>                       |          |  |
| Early retirement                  | 0.30***  | Difficulty in meeting household expenses |
| Duration of employment in total   | 1.01     |  |
| N                                 | 2001     |  |

# Summary

- Consistent and strong gender effects
  - Women less likely than men to be currently working
  - Ever-worked women more likely to have retired early
  - Women less likely to be currently looking for work
- Caregiving as the most cited reason for early retirement among women
- Most frequently cited reason for early retirement among men (and second most frequently by women) is own ill health
- Worse health associated with lower likelihood of current work or looking for work, and higher likelihood of early retirement

# Summary

- Work-related factors among the second most cited reason for men to retire early
  - Being made redundant, fed up and seeking change, being offered retirement incentives
- Work associated with income adequacy
  - Individuals who report income inadequacy less likely to be currently working
  - Older adults who are currently looking for work are those who are financially worse-off

# Summary

- Significant proportion of men (27%) and women (49%) in age group of 60-64 years not working
  - All would have been younger than 62 in 2012, and consequently would have been eligible for reemployment till 65, based on RRA 2012
  - Exit from the workforce likely to have happened before 62
  - Further research needed on extent to which RRA enables older workers to remain in workforce, for how long

# Work or Leisure?

- Work and leisure are usually considered to be diametrically opposite activities
- However, income as major reason for work suggests that work is essential for many older adults
- At the same time, data shows that work is motivated by social contact, maintenance of health, and even by the fact work is enjoyed (albeit more by women than men!)
  - Work and leisure are complementary for some
- Work is intrinsic to the social, financial, and physical lives of older Singaporeans

# Policy Implications

- Focus on young-old cohort aged 60-64
  - Education, housing type, income adequacy were not significant correlates of current work in this age group
- Work-place health and wellness initiatives that start at younger ages
- Workplaces more amenable to older workers
  - More flexible work arrangements, part-time work, job sharing
  - About one-third of those aged 60-64, 65-69, and men currently working are in part-time work, while nearly half of working older women are in part-time work
- Alternative viable caregiving resources such as daycare facilities for children and older family members need to be explored

# Policy Implications

- Tripartite Workgroup on Older Workers: gradual increase in retirement age and re-employment age
- Need to highlight principles and showcase models of good industry practices that encourage older workers
  - Evaluate benefits of skills upgrading
- Opportunities for work for those who would like to work
- Conducive work environment for everyone

Thank you!
